BUSINESS INSIGHT REPORT

Retail Sales and Store Performance Dataset

Interactive Power BI Dashboard Analysis

Figure 1: Retail sales dashboard, KPI page (no filters applied).

Course / Module	B.Com Fintech with AI
Date	11 November 2026
Data source	Retail sales Power BI report (KPI, Dashboard and Tool Tip pages)

1. Introduction

1.1 About the retail sales dataset

The retail sales dataset is an interactive Power BI report that tracks sales of consumer electronics across stores in several Indian cities and an online channel. The dashboard summarises about 15K transactions covering 112K units sold, with a total revenue of about 718 million, an average unit price of 41.99K, a total cost of about 4 billion and a sum of total profit of 9.80 billion.

Sales are broken down by store type (Urban, Flagship, Mall, Online and others), store name, city, product category (Mobile Phones, Laptops, Televisions, Home Appliances, Audio, Wearables and Accessories) and month. Total Revenue, Total Cost, Total Profit, Total Quantity and Total Transactions are the core measures that drive the visuals.

1.2 Purpose of the dashboard

The dashboard gives a manager one place to monitor revenue, cost, profit, units sold and order counts, and to see where the revenue comes from by channel, location, product and month. On the interactive page, four slicers (date range, customer segment, state and store name) let a user narrow every visual without building a new report. A custom Tool Tip page adds a quick four-measure summary when the user hovers over a chart element.

1.3 Purpose of this Business Insight Report

The dashboard shows what the data says; this report explains what it means. It interprets each KPI and chart, separates observations (what the data shows) from insights (what the observation means for the business), and turns those insights into practical recommendations for sales, merchandising and reporting. All numbers come from the supplied screenshots, and values read from chart shapes are marked as estimates.

2. Dashboard Overview

2.1 Dashboard screenshot

Figure 2: Interactive dashboard page with date, customer segment, state and store name slicers.

2.2 What the dashboard answers

The dashboard answers six everyday questions: How much revenue, cost and profit does the business make? How many units and transactions does that involve? Which store types and stores bring in the most revenue? Which cities perform best? Which product categories sell and earn the most? How does revenue move from month to month?

2.3 Key components

KPI cards: six headline measures: Average Unit Price (41.99K), Total Cost (4bn), Sum of Total Profit (9.80bn), Total Quantity (112K), Total Revenue (718.02… on screen) and Total Transactions (15K).

- **Total Revenue by store_type (donut):** the share of revenue from Urban, Flagship, Mall, Online and other store types.
- **Total Revenue by Year and month_name (line):** revenue for each month, starting from April 2024.
- **Sum of Total profit by category (treemap):** the share of profit contributed by each of the seven product categories.
- **Total Revenue by store_name (bar):** revenue of individual stores, from Bengaluru Orion Flagship to Online Store.
- **Total Revenue by city_name (column):** revenue for the ten cities, led by Pune, Mumbai and New Delhi.
- **Total Revenue by category (column):** revenue for each product category, led by Mobile Phones.
- **Slicers:** full_date (12-01-2024 to 11-01-2026), customer_segment, state_name and store_name, which filter every visual at once.

- **Tool Tip page:** a hidden page that shows Total Quantity, Total Orders, Total Revenue and Sum of Total Profit when the user hovers over a chart element.

2.4 Interactive filters and tooltip

The four slicers control every visual on the Dashboard page at the same time, and clicking a chart element also cross-filters the rest of the page. For example, choosing a state narrows the cards, the store list and the category charts to that state, and moving the date slider limits all measures to the chosen period. The tooltip page, shown below in design view, appears as a floating card when a user hovers over a chart element.

Figure 3: Tool Tip page design showing four KPI cards (Total Quantity, Total Orders, Total Revenue, Sum of Total Profit).

3. KPI Analysis

Figure 4: Headline KPI cards from the dashboard.

3.1 Volume and order size

The report records about 15K transactions and 112K units sold, which is roughly 7.5 units per transaction. This is a high figure for electronics, so many orders are likely bulk or multi-item purchases, or the transaction card counts invoices rather than individual customer orders. Dividing the revenue of about 718 million by 15K transactions gives roughly 48K of revenue per transaction.

3.2 Unit price and revenue

The average unit price of 41.99K matches the product mix, which is dominated by mobile phones, laptops and televisions. However, 41.99K multiplied by 112K units is about 4.7 billion, which is far

above the revenue card of about 718 million and close to the total cost card of 4 billion. The revenue card may therefore be defined after discounts or on a different basis from the unit-price card, and this needs to be confirmed.

3.3 Cost and profit

Total cost (4bn) is much larger than total revenue (about 718M), which on a simple reading would mean a loss, yet the profit card shows a positive 9.80 billion. Profit larger than revenue cannot come from revenue minus cost, so the profit measure is most likely calculated differently (for example, a sum of row-level profit values over a different base). The profit and cost cards should be treated as unverified until their definitions are checked with the data owner.

3.4 Summary of KPIs

KPI	Value	Interpretation
Average Unit Price	**41.99K**	**High-ticket electronics mix.**
Total Cost	**4bn**	**Close to 41.99K × 112K units (about 4.7bn).**
Sum of Total Profit	**9.80bn**	**Larger than revenue and cost; definition must be verified.**
Total Quantity	**112K**	**About 7.5 units per transaction.**
Total Revenue	**≈ 718M**	**Card is truncated (718.02…); unit inferred from the category chart.**
Total Transactions	**15K**	**About 48K revenue per transaction.**

4. Store Type and Location Analysis

This section analyses the Total Revenue by store_type, store_name and city_name charts.

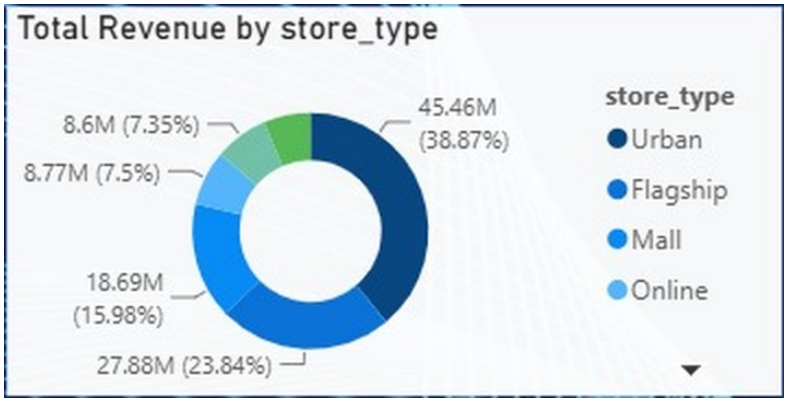

Figure 5: Total Revenue by store_type (donut chart from the dashboard).

Store type	Revenue	Share of revenue
Urban	**45.46M**	**38.87%**
Flagship (by colour order)	**27.88M**	**23.84%**
Mall (by colour order)	**18.69M**	**15.98%**
Online	**8.77M**	**7.5%**
Another type (label cut off)	**8.6M**	**7.35%**

The five labelled slices add up to about 93.5%; the remaining share is not labelled in the screenshot, and the legend is cut off, so the names of the last slices are inferred from colour order.

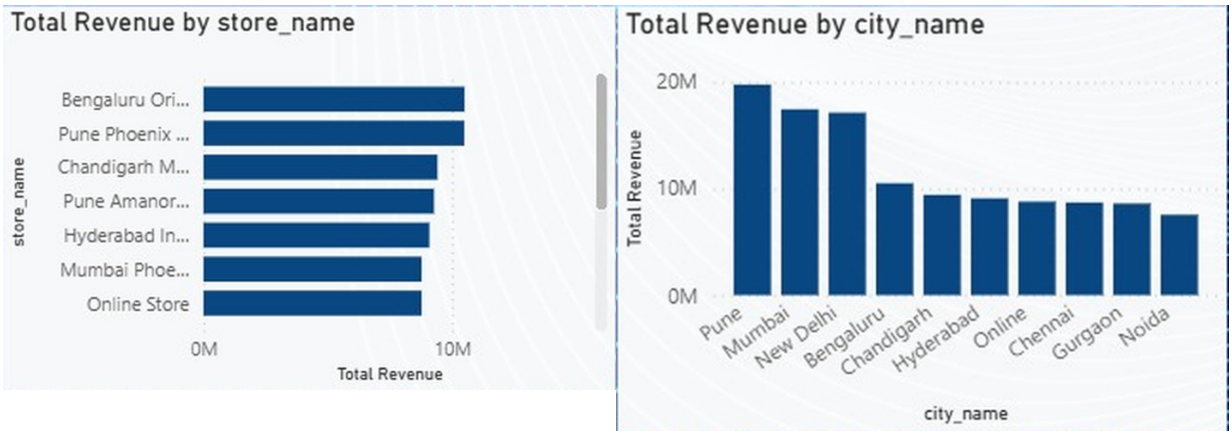

Figure 6: Total Revenue by store_name (left) and by city_name (right).

- **Leading store type:** Urban stores bring in 45.46M, or 38.87% of revenue, ahead of Flagship stores at 23.84%.
- **Online channel:** Online contributes 8.77M (7.5%), the smallest of the named store types, so the business is still store-led.
- **Top stores (estimates):** Bengaluru Orion Flagship and Pune Phoenix lead at about 10.5M each, followed by Chandigarh Mall and Pune Amanora at about 9.3M. The visible stores, including Online Store, all fall within about 8.8M to 10.6M.
- **Top cities (estimates):** Pune (about 19.6M), Mumbai (about 17.3M) and New Delhi (about 17M) together make up close to half of the ten-city total of about 116M. Noida is the lowest at about 7.5M.

> **Key Insight:** Revenue is spread fairly evenly across stores but concentrated in three metro cities and in Urban stores. The city chart also lists “Online” as a city, which means the online channel is stored as a location; it should be separated from physical cities so that city rankings are not mixed with channel results. Note also that the store type, store and city charts each add up to about 117M, while the Total Revenue card and the category chart point to about 718M. This gap of roughly six times must be explained before the location charts are used for financial decisions.

5. Product Category Analysis

This section analyses the Total Revenue by category column chart and the Sum of Total profit by category treemap.

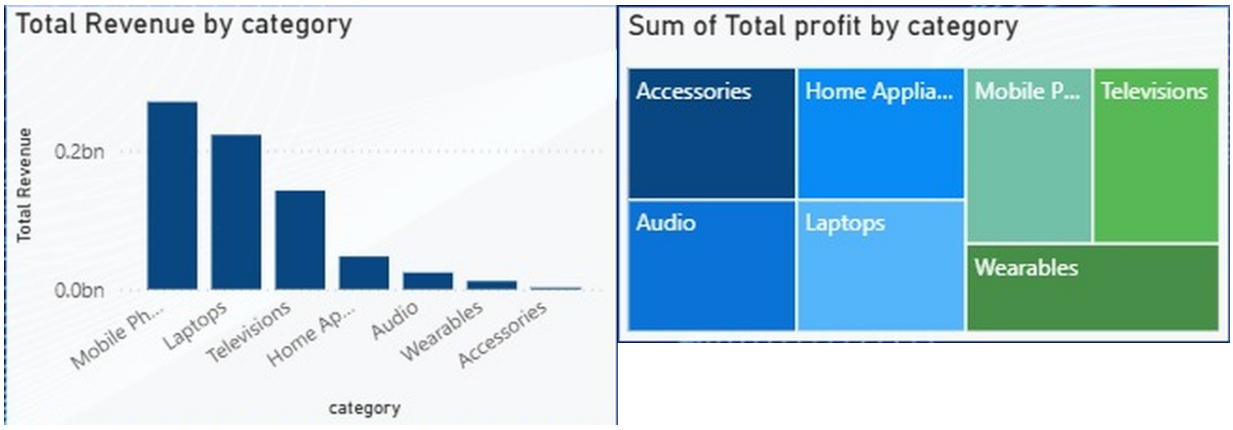

Figure 7: Total Revenue by category (left) and Sum of Total profit by category (right).

Category	Revenue (estimate)	Approx. share
Mobile Phones	**0.27bn**	**37%**
Laptops	**0.22bn**	**31%**
Televisions	**0.14bn**	**19%**
Home Appliances	**0.05bn**	**6%**
Audio	**0.03bn**	**4%**
Wearables	**0.01bn**	**2%**
Accessories	**0.005bn**	**under 1%**

- **Revenue leaders:** Mobile Phones, Laptops and Televisions together generate roughly 85% to 90% of revenue.
- **Long tail:** Home Appliances, Audio, Wearables and Accessories are small, and Accessories is almost invisible on the chart.
- **Profit split:** in the treemap, all seven categories occupy blocks of nearly equal size, with Accessories drawn as one of the largest.
- **Sum check:** the category revenue bars add up to about 0.72bn, which agrees with the Total Revenue card.

> **Key Insight:** The business depends heavily on three product lines for revenue, so stock, pricing and promotion decisions on phones, laptops and televisions have the largest effect on results. The treemap, however, shows profit spread almost evenly across categories even though revenue differs by about 50 times between Mobile Phones and Accessories. Either the profit measure is not linked to revenue, or low-revenue categories such as Accessories carry unusually high margins. The profit calculation should be validated before margin-based decisions are made.

6. Monthly Trend Analysis

This section analyses the Total Revenue by Year and month_name line chart.

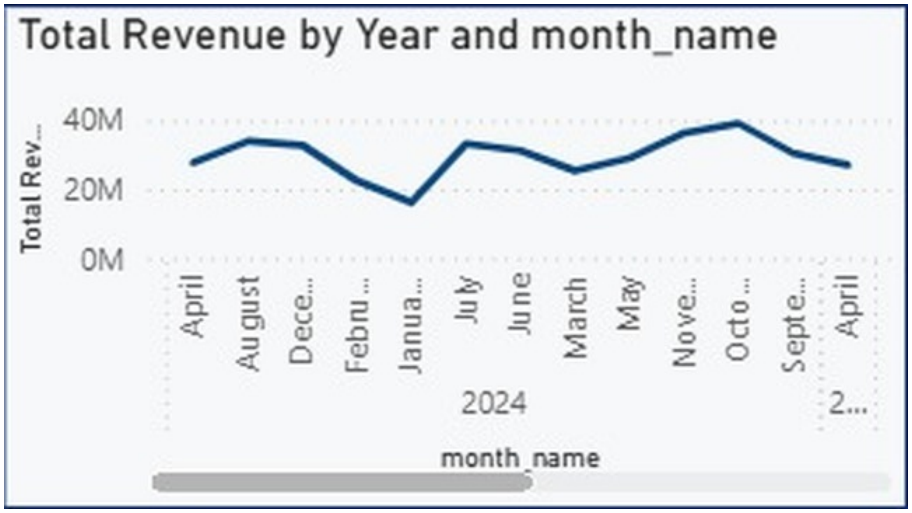

Figure 8: Total Revenue by Year and month_name (from the dashboard).

- **Range:** monthly revenue moves between roughly 15M and 40M (estimates read from the chart).
- **Peak:** the highest points are October (about 39M) and November (about 37M), which fits the festival and holiday shopping season.
- **Low point:** January is the lowest month at about 15M, with February also low at about 22M.
- **Mid-year level:** June, July, August and December sit near 32M to 34M, while March, May and September fall between roughly 26M and 31M.
- **Axis order:** the months on the x-axis are in alphabetical order (April, August, December, February, January, and so on) rather than calendar order, so the line does not show a true time sequence.

> **Key Insight:** Revenue is seasonal, with a strong Q4 peak and a weak start of the year. Because the months are sorted alphabetically, the line goes up and down in a way that looks like volatility but is partly an artefact of the sort order. Sorting month_name by month number would turn the chart into a proper trend line and make it much easier to plan stock and campaigns around the October to November peak and the January slowdown.

7. Business Insights

Each insight below pairs an observation (what the data shows) with the insight (what it means for the business).

Insight 1: Three product lines drive the business

Observation: Mobile Phones, Laptops and Televisions contribute roughly 85% to 90% of category revenue.

Insight: Revenue is highly dependent on a few high-value categories, so availability, pricing and supplier terms for these products matter most. Smaller categories could be used as add-on sales to lift basket value.

Insight 2: Urban stores and three metros lead sales

Observation: Urban stores generate 38.87% of revenue, and Pune, Mumbai and New Delhi together account for close to half of city revenue.

Insight: Performance is concentrated, which is an opportunity to replicate what works in these locations and a risk if one of them slows down. Weaker cities such as Noida may need local promotions.

Insight 3: Online is still a small channel

Observation: Online contributes 8.77M, or 7.5% of store type revenue, similar to a single mid-sized store.

Insight: There is room to grow online sales, particularly for high-value products that customers are used to researching online.

Insight 4: Revenue is seasonal

Observation: Monthly revenue peaks in October and November and drops to its lowest point in January.

Insight: Inventory, staffing and marketing budgets should be planned for the Q4 peak, with offers used to lift the weak early-year months.

Insight 5: Some measures do not reconcile

Observation: Cost (4bn) exceeds revenue (about 718M), profit (9.80bn) exceeds both, and the location charts add up to about 117M against 718M on the revenue card.

Insight: The numbers in different visuals are probably calculated on different bases or filters. Until this is clarified, the dashboard is reliable for comparing categories, stores and months, but not for stating absolute profit or total revenue.

8. Business Recommendations

The following recommendations follow directly from the insights above.

- **Validate measures:** Confirm the definitions of Total Revenue, Total Cost and Total Profit, show the full value of the truncated revenue card, and add the currency label.
- **Fix the month order:** Sort month_name by month number so the line chart shows the true monthly trend from April 2024 onward.
- **Clean the slicers:** The customer_segment slicer lists both “PREMIUM” and “Premium”; merge them so segment results are not split.
- **Separate online from cities:** Treat Online as a channel, not as a city, so that location rankings are accurate.
- **Focus on key categories:** Protect stock and pricing for Mobile Phones, Laptops and Televisions, and promote Accessories and Audio as add-ons.
- **Plan for seasonality:** Build campaigns and inventory around the October to November peak and run offers in January and February.
- **Add margin views:** Add a profit margin by category and store view once the profit definition is confirmed.

9. Conclusion

Overall dashboard findings

The retail dashboard summarises about 15K transactions and 112K units sold, with total revenue of about 718 million. Urban stores and the cities of Pune, Mumbai and New Delhi lead in sales, Mobile Phones, Laptops and Televisions dominate the categories, and monthly revenue peaks in October and November.

Most important business insight

Sales depend on a small number of product lines and locations and follow a clear seasonal pattern. The main priority is to protect and grow these strengths while resolving the inconsistencies between the revenue, cost and profit figures.

Key recommendation

Validate the KPI definitions, fix the month sorting and slicer data quality, and then use the dashboard to plan stock and campaigns around the high-value categories and the Q4 peak.

How the dashboard helped in the analysis

The KPI cards, donut, bar, column and treemap visuals and the monthly line chart turned a large sales table into a small set of comparable measures. The date, segment, state and store slicers, together with the tooltip page, make it possible to drill into any store, region or period without leaving the report.
